

# Flows through Taipei station area

The station area is a complex structure with multiple levels and a large number of people. The flow of people is a key factor in the design of the station. The station is designed to be a central hub for the city, with a large number of people passing through it every day. The station is designed to be a central hub for the city, with a large number of people passing through it every day. The station is designed to be a central hub for the city, with a large number of people passing through it every day.

The position of columns were established along a new through wall (vertical wall). The existing floor was demolished to remove the floor and the structural ceiling beam which was under the ground surface in accordance to the master plan for the ground floor of building.

After the structure was constructed of existing form which was removed at the position to expose the beam column, there is a construction drawing to help create.
